FREE 30 Day Trial.

RecordTS delivers security, compliancy, troubleshooting, and corporate surveillance under one monitoring program.

RecordTS is the first Terminal Services and Remote Desktop (Microsoft RDP/Citrix ICA) session recording solution available. RecordTS allows you to record and audit users and their activities. The program also permits the recording of administrators, external vendors, and consultants' activities while logged into your network using the built-in Remote Desktop feature or the Citrix ICA client on any Windows Servers.

Security and Compliancy Assistance

RecordTS acts as a Terminal Services or Remote Desktop "security camera" by recording the user activity conducted on your servers. RecordTS takes security to a new level by not only capturing screen activity but also transferred files, print jobs, and keystrokes, making it an ideal solution to assure ethical user activity. It provides the option to record specified users at pre-defined times and stores metadata such as server accessed, date/time, IP address, and more. You can also monitor the access of files or programs that contain sensitive or confidential information, for example financial data, customer information, or personnel records. This information can be used to confirm you are meeting compliancy and security requirements.

Troubleshooting Support

Another significant use of RecordTS is the troubleshooting assistance it can provide. For instance, if an error occurs during a migration, an administrator can simply review the RecordTS video file to determine what happened and then take corrective actions. The program can also be set to record a specific user's activity allowing you to review their activity leading up to a problem they have been having. This makes troubleshooting much easier than sorting through events logs as it shows exactly what happened. RecordTS can also be used to track network changes like server upgrades, which eliminate the need to write down or remember server configurations.

Corporate Surveillance

RecordTS is the answer for any company looking for a product that can perform as your network's "security camera". The starting point for many data leaks and corporate betrayal comes from within a company. Instead of management holding the role of investigator, or administrators sorting through event logs, RecordTS allows companies to review and react to wary behavior. It is an excellent tool for call centers, financial institutions, government agencies, and other high security environments as you are able to audit user activity with the video files produced by RecordTS.
