

Security and Compliancy Assistance

Recording sessions allows you to monitor access to files or programs that contain sensitive or confidential information; for example financial data, customer information, or personnel records. This information can be used to confirm you are meeting compliancy and security requirements.

Built for the Cloud and Virtualized Environments

From the ground up, RecordTS was designed to work in hosted environments, making it a tightly integrated solution to monitor remote access to your cloud infrastructure. RecordTS works well with VMware, Hyper-V, XenServer and other virtual hosting environments built on a Windows Server virtual machine.

Complete Recording System on One Machine

RecordTS Single Server Edition installs everything you need onto one machine, making it a simple install and configuration. Session video is streamed to a local database for easy playback and review.

Powerful and Budget Friendly!

Record up to 25 remote users simultaneously with very little noticeable load on the server and store the session videos for as long as you need them. Play back videos on demand, while the user is still logged in. Add on more users if needed.

Free Technical Support & Upgrades

Sold with annual Software Assurance plan. Call for details.

Trusted by major hospitals, banks and governments worldwide

Features:

Video buffering
Extremely small footprint
Zero data loss
Record up to 25 users simultaneously
